Beer SV; Wei Z, Bogdanove AJ, Kim JF,

WPI; 1999-180362/15. N-PSDB; AAX24810. Nucleic acid encoding hypersensitive response-eliciting protein - used to improve growth of plants and impart resistance to disease and insects.

Claim 18; Page 51-56; 75pp; English.

This polypeptide comprises the 198 kDa hypersensitive response elicitor protein DSpE of Erwinia amylovora. The nucleotide sequence of the dsp protein DSpE of Erwinia amylovora. The nucleotide sequence of the dsp pCPP430. A two-gene operon was discovered comprising dspE (see AAX24810) and dspF (see AAX24811). The isolated dsp DNA molecules and encoded proteins can be used to impart disease resistance to plants, to enhance plant growth, and/or to control insects on plants. This is achieved by applying a hypersensitive response elicitor protein or polypeptide in a non-infectious form to plants or plant seeds, or by producing transgenic plants or plant seeds transformed with DNA encoding a hypersensitive response elicitor. Protection can be provided against a wide range of viruses, bacteria, fungi and insects, e.g. tobacco mosaic virus and tomato mosaic virus, Pseudomonas syringae, Xanthomonas campestris,

ô Fusarium oxysporum, Phytophthora infestans, armyworm, diamondback moth, etc. The method avoids use of infectious agents or polluting chemicals. Claimed transgenic plants are selected from alfalfa, rice, wheat, barley, rye, cotton, sunflower, peanut, corn, potato, bean, pea, chicory, lettuce, endive, cabage, brussel sprout, sweet potato, beet, parsnip, turnip, cauliflower, broccoli, turnip, radish, spinach, onion, garlic, eggplant, pepper, celery, carrot, squash, pumpkin, cucumber, apple, pear, melon, citrus, strawberry, garpe, raspberry, pineapple, sovbean, tobacco, tomato, sorghum, sugarcane, Arabidopsis thaliana, Sainpaulia, petunia, pelargonium, poinsettia, chrysanthemum, carnation 120 120 180 180 240 240 300 300 360 360 420 480 420 480 540 9 600 600 999 99 720 720 780 840 840 LDGAAYLLKDGEVKRLNINQSTSSIKHGTENVFSLPHVRNKPEPGDALQGLNKDDKAQAM 780 MELKSLGTEHKAAVHTAAHNPVGHGVALQQGSSSSSPQNAAASLAAEGKNRGKMPRIHQP MELKSLGTEHKAAVHTAAHNPVGHGVALQQGSSSSSPQNAAASLAAEGKNRGKMPRIHQP STAADGISAAHQQKKSFSLRGCLGTKKFSRSAPQGQPGTTHSKGATLRDLLARDDGETQH EAAAPDAARLTRSGGVKRRNMDDMAGRPMVKGGSGEDKVPTQQKRHQLNNFGQMRQTMLS EAAAPDAARLTRSGGVKRRNMDDMAGRPMVKGGSGEDKVPTQQKRHQLNNFGQMRQTMLS KMAHPASANAGDRLQHSPPHIPGSHHEIKEEPVGSTSKATTAHADRVEIAQEDDDSEFQQ LHQQRLARERENPPQPPKLGVATPISARFQPKLTAVAESVLEGTDTTQSPLKPQSMLKGS GAGVTPLAVTLDKGKLQLAPDNPPALNTLLKQTLGKDTQHYLAHHASSDGSQHLLLDNKG 301 GAGVIPLAVILDKGKLQLAPDNPPALNTLLKQTLGKDTQHYLAHHASSDGSQHLLLDNKG HLFDIKSTATSYSVLHNSHPGEIKGKLAQAGTGSVSVDGKSGKISLGSGTQSHNKTMLSQ PGEAHRSLLTGIWQHPAGAARPQGESIRLHDDKIHILHPELGVWQSADKDTHSQLSRQAD 361 HLFDIKSTATSYSVLHNSHPGEIKGKLAQAGTGSVSVDGKSGKISLGSGTQSHNKTMLSQ KMKAMPQHALDEHFGHDHQISGFFHDDHGQLNALVKNNFRQQHACPLGNDHQFHPGWNLT DALVIDNQLGLHHTNPEPHEILDMGHLGSLALQEGKLHYFDQLTKGWTGAESDCKQLKKG LDGAAYLLKDGEVKRLNINQSTSSIKHGTENVFSLPHVRNKPEPGDALQGLNKDDKAQAM GKLYALKDNRTLQNLSDNKSSEKLVDKIKSYSVDQRGQVAILTDTPGRHKMSIMPSLDAS PESHISLSLHFADAHQGLLHGKSELEAQSVAISHGRLVVADSEGKLFSAAIPKQGDGNEL DALVIDNQLGLHHTNPEPHEILDMGHLGSLALQEGKLHYFDQLTKGWTGAESDCKQLKKG AVIGVNKYLALTEKGDIRSFQIKPGTQQLERPAQTLSREGISGELKDIHVDHKQNLYALT ; Length 1838; Indels 7 . 0 DB 100.0%; Score 9448; 100.0%; Pred. The present sequence is a hypersensitive response elicitor encoded by dspE gene from Erwinia amylovora. The protein elicits plant pathogen's hypersensitive response and is used to impart stress

The polyunclectide represents the dspE gene. The specification describes hypersensitive response elicitor polypeptide fragments, which do not elicit a hypersensitive response. Instead, the proteins impart disease resistance to plants, enhance plant growth, and/or control insects. The polypeptide fragments may be used to these properties to plants. The plants which may be treated in this way include vegetables, crops and ornamental plants such as alfalfa, rice, wheat, barley, rey, cotton, sunflower, peanut, corn, potato, sweet potato, bean, pea, chicory, lettuce, endive, cabbage, burssel sprout, beet, parsnip, turnip, cauliflower, broccoli, radish, spinach, onion, garlic, eggplant, pepper, celery, carrot, squash, pumpkin, zucchini, cucumber, apple, pear,

(dspE) polypetide, which elicits a hypersensitive response in plants. The dspE operon functions as an avirulence (avr) locus and the dspE protein is required for pathogenicity of Erwinia amylovora. DspE is also responsible for causing fireblight in certain plants. The protein and its associated nucleic acid can be applied in a non-infectious form to plant seeds to inpart disease resistance, to enhance plant growth, and/or to control insects on plants. Alternatively, plant cells may be transformed with the DNA to form transgenic plants with the same

sequence represents an Erwinia amylovora disease-specific region E

Claim 1; Col 9-18; 37pp; English.

Polynucleotides encoding hypersensitive response eliciting proteins polypeptides useful for imparting disease resistance to plants, to enhance plant growth, and/or to control insects on plants.

pollution, chemical an untrinical stress. The method of imparting disease resistance has the potential for treating previously untreatable diseases retistance has the potential for treating previously untreatable diseases, treating diseases systemically and avoiding the use of infectious agents or environmentally harmful materials. Hyper-sensitive response elicitor sequences are used to enhance plant growth which encompasses greater yield, increased in quantity of seeds produced, percentage of seeds germinated, plant size and biomass, bigger fruits, earlier fruit coloration and plant maturation. They are also used for insect control which encompasses preventing direct insect damage to plant by feeding injury, interfering with insect larval feeding on the plants, sequences of the invention also prevent subsequent disease damage to plants sequences of the invention also prevent subsequent disease damage to plants maylovora hypersensitive response elicitor protein, dspE climate, resistance to environmental stresses such as

The dspE operon functions as an avirulence (avr) locus and the dspE protein is required for pathogenicity of Erwinia amylovora. DspE is also responsible for causing fireblight in certain plants. The protein and its associated nucleic acid can be applied in a non-infectious form to plants or plant seeds to impart disease resistance, to enhance plant growth, and/or to control insects on plants. Alternatively, plant cells may be transformed with the DNA to form transgenic plants with the same

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PPALNTLLKQTLGKDTQHYLAHHASSDGSQHLLLDNKGHLFDIKSTATSYSVLHNSHPGE 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence represents an Erwinia amylovora disease-specific region E (dspE) mutant polypeptide, which elicits a hypersensitive response in plants. The dspE operon functions as an avirulence (avr) locus and the dspE protein is required for pathogenicity of Erwinia amylovora. DspE is also responsible for causing fireblight in certain plants. The protein and its associated mucleic acid can be applied in a non-infectious form to plants or plant seeds to impart disease resistance, to enhance plant growth, and/or to control insects on plants. Alternatively, plant cells may be transformed with the DNA to form transgenic plants with the same properties. The method can be utilised to treat a wide variety of plants and seeds, including crop plants such as rice, wheat, corn, cabbage, cauliflower, garlic, cucumber, apple, grape, tobacco and sugarcane, and connamental plants such as Arabidopsis thaliana, petunia, chrysanthemum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

The present sequence represents a functional type III secretion system from the N-terminal domain of the DspE protein. The DspE protein is secreted by a type III secretion system. The DspE secretion signal is comparible with the hairpin secretion system of Erwinia amylovora. The secretion signal polynucleotide is used to produce the constructs of the invention, which also comprise a promoter and a second DNA that encodes a protein or polypeptide that can be secreted by the type III secretion signal. Host cells containing the constructs are used for recombinant production of the polypeptide. The constructs are also used to screen for potential effector proteins, e.g. Avr (avirulence) proteins potentially

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. Luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymeptides encoded by the genes are used for detection/identification of P. Luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. Luminescens and are able to alter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                       Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are proteins from Photorhabdus luminescens. The isolated sequences are sources of probles and primers for detection, the genome of F. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypoptides encoded by the genes. Antibodies (Ab) raised against the collypoptides encoded by the genes. Antibodies (Ab) raised against the polypoptides encoded by the genes. Proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that companials or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. C. Tecombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The carpentically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as C. therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens and the proteins are as virulence factors and for identifying targets of human diseases for which P. C. luminescens is a model (particularly plaque and whooping cough). This sequence represents one of the isolated P. luminescens proteins

Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of F. Luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. Luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         89 SRSAPQGQPGTTHSKGATLRDLLARDDGETQHEAAAPD--AARLTRSGGVK--RRNMDDM 144
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for encombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1865 LYLNTHGOKLTNTQSG----DDLGIRSDSDLTLEAGEIDNTAGKIDSQGETKLTSQNLNNT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neisseria gonorrheae; antigen; vaccine; munogenic; infection; meningitis; septicaemia;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     represent novel Neisseria meningitis and NaY74253 to AAY75941 represent novel Neisseria meningitis and N gonorrheae polynucleotides and polypeptides. AZZ5437 to AAZ5456 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as inmunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to sorreen for agonists or antegonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           132

antibodies against a commensal bacteria, or an extract from a commensal bacteria; (b) contacting the antibodies with polypeptides obtained from an expression library of either a commensal or a pathogenic bacteria; (c) determining whether the polypeptides bind to antibodies; and (d) (where a polypeptide binds to an antibody) identifying that polypeptide as an antigen. Also included are: (1) a method of preparing a vaccine composition, comprising identifying an antigen with the above method, and combining the antigen with a carrier; (2) a vaccine composition obtained by the above methods; (3) an antigen identified by the above methods; (4) a part of a nucleic acid sequence comprising the Neisseria lactamica DNA sequences detailed in the specification; (5) a vector comprising the nucleic acid molecule; (6) a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The polypeptide is useful as a vaccine antigen which may be used in the manufacture of a medicament for vaccination against meningococcal infection (e.g. meningitis). The present sequence represents an antigenic protein from the pathogenic bacteria N. meningitidis. (Updated on 23-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                             invention relates to identifying an antigen comprising: (a) obtaining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        method of preparing a composition for vaccination against infection by pathogenic bacteria, comprising; (a) obtaining a first antigen from a commensal Neisseria; (b) comparing the amino acid sequence of the first antigen with the amino acid sequence of the second antigen from a pathogenic bacteria, or comparing the sequence of a nucleic acid which codes for the first antigen, and if the first antigen is howologous to the second antigen, and if the first antigen is howologous to the second antigen, and (c) preparing a howologous to that of the second antigen, and (d) preparing composition for vaccination against bacterial infection comprising the first antigen; and (7) an antibody that binds to the polypeptide antigen. The method is useful in screening commensal and pathogenic bacteria for previously unidentified vaccine antigens by identifying polypeptide antigen antigens that bind to sera raised against commensal bacterial proteins.
                                                                                                                                     Identifying an antigen for manufacturing a vaccine against meningococcal infection, comprises contacting antibodies with polypeptides, detecting polypeptide-antibody complexes, and identifying bound polypeptides as
                                                                                                                                                                                                                                                                                    Claim 37; Page 156-164; 310pp; English.

2003-029926/02 N-PSDB; ACA42067 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

25; SEQ ID NO 66121; 1766pp; English.

the invention retailers to an isolated nucleic acid comprising any one or the invention retailers of an isolated nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid confloring a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated of polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular or proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway or equired for that has an activity against a biological pathway required for proliferation, (7) identifying a compound that influences the activity of identifying a gene required for cellular proliferation or the biological pathway in which a proliferation or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the strains is present in a culture or collection of an compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the strains; or (13) identifying the target of a compound that inhibits the collection of an organism. The antisense nucleic acids are useful for strains; or (13) identifying the target of a compound that inhibits the collidar proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids acids required for proliferation in cells other than S. arrens, S. typhimurium, C. R. pneumoniae or P. servenial and proper expenses sequence is encoded by one of the target prosecular and proverse processed. K. preumoniae or P. aeruginosa. The present sequence is encoded by one or the target prokaryoric essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained invention relates to an isolated nucleic acid comprising ftp.wipo.int/pub/published\_pct\_sequences

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1, Application US/09350852A
Patent No. 6596509
GENERAL INFORMATION:
APPLICANT: Bauer, David W.
APPLICANT: Beer, Steven V.
APPLICANT: Bogdanove, Adam J.
APPLICANT: Ham, Jong Hyun
ITLE OF INVENTION: RECOMBINANT CONSTRUCTS AND SYSTEMS FOR SECRIFITLE OF INVENTION: PROTEINS VIA TYPE III SECRETION SYSTEMS
FILE REFERENCE: 19603/2061
CURRENT APPLICATION UNDRER: US/09/350,852A
CURRENT FILING DATE: 1999-07-09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    QDQNTPRRFTLEGGIAQANPQVASALTDLKKEGLEMKS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QDQNTPRRFTLEGGIAQANPQVASALTDLKKEGLEMKS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 3

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
